Report Overview

A 3D Time-of-Flight (TOF) camera is a range imaging device that uses the time it takes for light to travel from the camera to the subject and back to measure distance. It works by emitting a light signal, usually in the infrared spectrum, and then capturing the reflected signal to determine the distance of each point in the scene. This allows the camera to create a three-dimensional representation of the scene with high precision. 3D TOF cameras are widely used in various applications such as gesture recognition, object detection, autonomous navigation, and augmented reality.
