Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on 4-Acetoxy Styrene competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global 4-Acetoxy Styrene production reached approximately 516 tons, with an average global market price of around US\$ 159 per kg. 4-Acetoxy Styrene is the acetate ester of 4-vinylphenol (p-hydroxystyrene). It is a colorless liquid monomer (formula $C_{10}H_{10}O_2$) that undergoes free-radical polymerization and copolymerization. The resulting poly(4-acetoxy Styrene) can be hydrolyzed/transesterified to poly(4-vinylphenol) (PHS), a key resin used in microelectronic photoresists. As a protected precursor to poly(4-vinylphenol) (PHS), 4-acetoxy Styrene plays a pivotal role in photoresists and microelectronics materials. Its good reactivity in free-radical and controlled radical polymerizations (e.g., NMP, RAFT) enables copolymer design with styrene or acrylates to tune polarity, T_g , and film properties, serving needs in flat-panel displays, semiconductor patterning, and electronic encapsulation. Literature and patents routinely use this monomer to access PHS via polymerization followed by hydrolysis/transesterification. On the demand side, continued usage of PHS or its functional copolymers in photoresists, along with coatings/adhesives/sensing applications that favor phenolic polymers with controllable polarity, keeps the molecule attractive. Concurrently, process routes that polymerize 4-acetoxy Styrene and then deprotect to PHS are being optimized for greener, lower-byproduct manufacturing to meet stringent electronics-grade standards.

The global 4-Acetoxy Styrene market size was estimated at USD 82.04 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
