Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on 4-Allyloxybenzaldehyde competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of 4-Allyloxybenzaldehyde was approximately 120 tons, with an average selling price of about US\$560/kg. The single-line capacity was approximately 8 tons/year, with an average gross profit margin of about 30%.

4-Allyloxybenzaldehyde is an important organic synthesis intermediate. Its chemical structure can be defined as an aromatic aldehyde compound formed by replacing a hydrogen atom at the para-position (position 4) of the aldehyde group on the benzene ring of the benzaldehyde molecule with an allyloxy group. This structure combines the reactivity of the aldehyde group with the unique rearrangement and polymerization properties of the allyl group, making it a key material for the synthesis of pharmaceutical molecules, functional polymers, and other fine chemicals. The upstream raw materials for 4-Allyloxybenzaldehyde mainly include p-hydroxybenzaldehyde, halopropanes, and necessary catalysts and solvents. Downstream, it mainly serves as a key pharmaceutical intermediate, used to construct the benzene ring skeleton of drug molecules, and is applied in the field of organic synthesis intermediates. It is an important material for the synthesis of various fine chemicals (such as liquid crystal materials and fragrances).

The global 4-Allyloxybenzaldehyde market size was estimated at USD 67.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
