Abstracts

4 Aminohippuric Acid (PAH), also known as para-aminohippuric acid, is a diagnostic agent primarily used in renal function testing to measure effective renal plasma flow (ERPF) and assess tubular excretory capacity. It functions by being actively secreted by the renal tubules, allowing clinicians to quantify kidney efficiency and detect impairments in renal blood flow or tubular function. Due to its specificity and reliability, PAH remains a standard tool in nephrology and clinical research for evaluating kidney health, particularly in conditions such as hypertension, renal artery stenosis, and drug-induced nephrotoxicity. Its application is largely confined to medical and laboratory settings, where it is administered intravenously and its clearance rates are meticulously measured to provide critical insights into renal physiology.

The global 4 Aminohippuric Acid (Pah) market size was estimated at USD 15.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
