Abstracts

4-Aminosalicylic acid (PAS), also known as para-aminosalicylic acid, is a bacteriostatic antimycobacterial agent primarily used in the treatment of tuberculosis (TB), particularly in cases involving drug-resistant strains or as part of combination therapy regimens. As a structural analogue of para-aminobenzoic acid (PABA), it competitively inhibits the synthesis of dihydrofolic acid in *Mycobacterium tuberculosis*, disrupting folate metabolism essential for bacterial growth and replication. Marketed under names such as Paser, it is often employed as a second-line drug when first-line treatments like isoniazid or rifampin are ineffective or not tolerated. Its usage has declined with the advent of newer, more potent antitubercular agents but remains relevant in specific clinical scenarios, especially in resource-limited settings or for managing multidrug-resistant TB (MDR-TB). The compound's stability, formulation challenges (e.g., granule formulations to improve gastrointestinal tolerance), and role within global TB control programs underline its continued, though niche, importance in infectious disease therapeutics.

The global 4 Aminosalicylic Acid (Pas) market size was estimated at USD 125.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
