Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on 4-Axis CNC Press Brake competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. 4-axis CNC press brake is a high-precision sheet metal bending equipment with four independently controllable motion axes. It is commonly used in sheet metal forming, precision mechanical structural parts processing, and metal parts manufacturing such as electrical cabinets and air conditioning housings. This model is usually equipped with four axes: X, R, Y1, and Y2. Y1/Y2 controls the synchronous downward movement of the upper mold, the X-axis controls the front and rear position of the back stop, and the R-axis is responsible for the up and down movement of the back stop, realizing flexible programming of complex bending process paths and angles. While maintaining the basic processing stability, the 4-axis structure significantly improves the bending automation and repeat positioning accuracy. In conjunction with graphical CNC systems (such as Delem, ESA, etc.), it can support multi-segment programming and rapid switching of multiple processes. It is widely used in small and medium-sized batch high-precision processing scenarios such as home appliances, chassis cabinets, engineering machinery, and automotive parts.

The global 4-Axis CNC Press Brake market size was estimated at USD 142.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
