Abstracts

The 4-axis Delta parallel robot is a robotic system based on a parallel mechanism. It primarily consists of a fixed platform (anchored to the base), a moving platform (connected to the end effector), and multiple linkages. Compared to traditional serial robots, its distinctive feature is that multiple linkages simultaneously drive the motion of the moving platform. Through the coordinated work of its four motion axes, the four-axis Delta robot enables the end effector to perform relatively complex movements in three-dimensional space, including translations in the X, Y, and Z directions, as well as rotations around a certain axis. This type of robot excels in high-speed, high-precision tasks, such as high-speed sorting and precision assembly operations.

The global 4-axis Delta Parallel Robots market size was estimated at USD 3146.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
