Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on 4-Piece Bronchus Model competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global 4-Piece Bronchus Model production reached approximately 1.2 M units, with an average global market price of around US\$ 175 per unit. A 4-Piece Bronchus Model is a specialized anatomical teaching and demonstration model designed to represent the structure and pathological variations of the human bronchial tree, particularly the segmental bronchi and associated airway tissues. The term "4-piece" refers to its modular design; the model is divided into four detachable sections, each illustrating a different physiological or pathological condition of the bronchi.

Gross Profit Margin Analysis As a standardized product in medical teaching and anatomical demonstration, the production cost of the four-piece bronchial model mainly consists of mold manufacturing, material costs, manual assembly, and distribution channels. Due to the relatively moderate core technology threshold and long product lifecycle of this type of model, the overall gross profit margin remains between 25% and 40%. High-end brands, by using high-fidelity silicone or precision injection molding technology and incorporating detachable, magnifiable, and layered labeling designs, achieve significantly higher unit prices and profit margins than basic plastic models. Meanwhile, mid-to-low-end manufacturers rely on large-scale production and OEM channels; although the profit per unit is lower, high shipment volumes maintain stable revenue. Overall, this product line has a stable profit model, low inventory risk, and is suitable for long-term supply and the annual procurement needs of educational institutions.

Driven Factors The main drivers of growth in the four-piece bronchial model market are the continued expansion of demand for digital transformation in medical education and simulation teaching. Globally, medical schools, nursing schools, and vocational training

centers are increasing their investment in visualization and interactive teaching equipment to replace traditional two-dimensional atlas teaching methods. Bronchial models are widely used in respiratory system teaching, bronchoscopy training, and the promotion of chronic respiratory disease prevention and control because they can visually demonstrate airway lesions and pathological progression. Furthermore, the widespread adoption of 3D printing and customized anatomical model technologies has further driven the iteration and upgrading of these products, making the models more closely resemble real human anatomy and enhancing the immersive learning experience.

The global 4-Piece Bronchus Model market size was estimated at USD 210.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
