Abstracts

4-Quadrant Photodiode are devices used to measure the position and intensity of a light spot on a surface. They consist of four photodetectors arranged in a quadrant configuration. When light falls on the surface, each photodetector generates a signal proportional to the intensity of the light in its respective quadrant. By analyzing the signals from all four detectors, the position of the light spot can be determined in both the X and Y directions. These detectors are commonly used in laser alignment systems, laser tracking systems, and optical position sensing applications where precise positioning and tracking of a light source are required

The global 4-Quadrant Photodiode market size was estimated at USD 110.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
