## Abstracts

A 4-Way Proportional Directional Valve is a type of hydraulic control valve designed to regulate the direction and flow rate of hydraulic fluid within a system with high precision. It features four ports—typically an inlet port, two outlet ports, and a return port—that control the movement of fluid to different parts of a hydraulic circuit. The 'proportional' aspect of the valve means that the flow of fluid can be finely adjusted in response to a variable control signal, rather than simply being fully opened or closed. This allows for smooth and precise control of actuators, such as hydraulic cylinders or motors, enabling variable speed and direction of movement. The 4-way configuration is particularly versatile, as it can manage the extension and retraction of a double-acting cylinder or the forward and reverse motion of a hydraulic motor. These valves are commonly used in industrial automation, mobile equipment, and machinery where precise control over the speed, direction, and force of hydraulic actuators is critical for efficient and accurate operation.

The global 4 Way Proportional Directional Valve market size was estimated at USD 440.03 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
