Abstracts

A 4-wire resistive touchscreen is a type of touch-sensitive input device consisting of two flexible, transparent layers coated with a resistive material and separated by insulating spacer dots. When pressure is applied to the top layer, it makes contact with the bottom layer, and the resulting voltage division at the point of contact is measured to determine the precise X and Y coordinates of the touch. This technology is known for its durability, low cost, and compatibility with various input methods, including fingers, styluses, and gloved hands, making it suitable for industrial, medical, and point-of-sale applications where reliability and affordability are prioritized over advanced features like multi-touch or high optical clarity.

The global 4 Wire Resistive Touchscreen market size was estimated at USD 2980.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -2.85% during the forecast period.
