Abstracts

Base station antenna is an important device in wireless communication system. It is installed on the base station and is responsible for sending and receiving signals. With the evolution of mobile communication technology, from 4G to 5G, the design and technology of base station antenna are also constantly improving to meet the communication needs of higher speed, lower latency and larger capacity. 4G base station antenna is mainly used to support the signal transmission of the fourth generation mobile communication network (LTE). They usually adopt multi-band design to cover different communication frequency bands and provide stable signal coverage and high-speed data transmission. 5G base station antenna is a key device to support the fifth generation mobile communication network. Compared with 4G, 5G base station antenna has higher frequency band, larger bandwidth, more antenna units and more complex beamforming technology. These characteristics enable 5G base station antenna to provide higher data transmission rate, lower latency and a larger number of connections. 4G and 5G base station antennas are key components in wireless communication networks. They are responsible for converting radio waves into wired signals or converting wired signals into radio waves, thereby realizing communication between mobile devices such as mobile phones and the network.

The global 4G and 5G Base Station Antennas market size was estimated at USD 28980.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
