Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on 5-Hydroxytryptophan (5-HTP) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. 5-hydroxytryptophan (5-HTP) is an intermediate product generated during tryptophan metabolism and is a direct precursor for the synthesis of serotonin (5-HT) in the body. 5-HTP participates in regulating mood, sleep, appetite, and nervous system function by supplementing serotonin levels. Due to its potential role in alleviating depression, anxiety, insomnia, and appetite control, 5-HTP is widely used in dietary supplements. Its main source is plant extraction, especially the African plant *Griffonia simplicifolia* seeds. It should be noted that high-dose use may cause side effects such as nausea or gastrointestinal discomfort, and should be taken under professional guidance. In 2024, global 5-Hydroxytryptophan (5-HTP) production reached approximately 587.99 MT, with an average global market price of around US\$ 114 per kg. 5-hydroxytryptophan is usually produced through specialized fermentation/extraction+refining equipment using African black pod tree seed extraction or engineering bacterial fermentation routes. The annual effective production capacity of a single mature production line is about 100-500 tons. The upstream mainly relies on black pod tree seeds or starch sugar sources, fermentation nutrients, and fine chemical reagents, while the downstream faces health products, functional foods, and pharmaceutical intermediate enterprises. Raw materials and fermentation/extraction consumables account for about 50-60% of the factory price in the cost structure, energy labor and equipment depreciation is about 15-20%, management and sales expenses are about 5-10%, and the comprehensive gross profit margin of the enterprise is roughly in the range of 20-30%. The high-purity pharmaceutical grade is slightly higher, and the general food grade is slightly lower. At present, the method of extracting 5-HTP from

natural products cannot meet market demand due to high cost and lack of raw materials. Chemical synthesis does not rely on natural products, however, due to the tedious steps and required conditions involved, it is difficult to synthesize 5-HTP economically and effectively. With the development of biotechnology such as bioinformatics, genetics, metabolic engineering, biochemistry, and protein engineering, new strategies have emerged for synthesizing 5-HTP using microorganisms. Microbial synthesis has the advantages of short production cycle, low cost, high yield, and easy large-scale production, and has great application prospects.

The global 5-Hydroxytryptophan (5-HTP) market size was estimated at USD 68.03 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.60% during the forecast period.
