Report Overview

The structure of the five-wire touch screen is similar to the four-wire resistive type, also having a lower wire (glass or film material) conductive ITO layer and an upper wire (film material) conductive ITO layer. The working principle of the five-wire touch screen is different from that of the four-wire resistive touch screen: the driving voltages in the X and Y directions of the five-wire touch screen are generated by the ITO layer of the lower line, while the upper line layer only acts as a detection voltage probe. Even if the upper line film layer is scratched or damaged, the touch screen can still work normally, so the service life of the five-wire resistive type is much longer than that of the four-wire type.

The global 5-Wire Resistive Touch Screen market size was estimated at USD 4741 million in 2023 and is projected to reach USD 6988.68 million by 2030, exhibiting a CAGR of 5.70% during the forecast period.

North America 5-Wire Resistive Touch Screen market size was USD 1235.37 million in 2023, at a CAGR of 4.89% during the forecast period of 2024 through 2030.
