### Report Overview:

With the increase in 5G frequency bands and higher frequencies, the number of RF front-end components has increased significantly. On the other hand, with the significant increase of 5G transmission data, higher requirements are placed on the data processing capability of the base station BBU, and the BBU will occupy a larger area. For higher-layer PCBs, high-speed and high-frequency materials are required for the substrate. The selection of the board must meet the requirements of high frequency and high speed, and the impedance matching, stacking planning, wiring spacing/holes, etc. must meet the signal integrity requirements, which can be determined from loss, embedding, high frequency phase/amplitude, mixed voltage, heat dissipation characteristics and PIM characteristics. The characteristics of 5G communication PCB are high density, integration, high frequency, multi-layer, miniaturization and high speed.

The Global 5G Base Station Printed Circuit Board Market Size was estimated at USD 2512.74 million in 2023 and is projected to reach USD 3564.37 million by 2029, exhibiting a CAGR of 6.00% during the forecast period.
