## Abstracts

5G Electronic Grade Resin is a high-performance material designed specifically for the production of 5G networks and devices, and is mainly used in the manufacture of high-frequency circuit boards, packaging materials, and various electronic components. The resin has a very high purity that prevents impurities from interfering with signal transmission or circuit performance, provides excellent electrical insulation, and ensures stability in high-frequency 5G applications. In addition, 5G electronics-grade resins need to have excellent thermal stability and chemical resistance to meet the challenges of high-temperature environments and exposure to chemicals, as well as good mechanical strength to withstand mechanical stress during device miniaturisation and manufacturing. Common resin materials include epoxy resins, polyimide resins, and bismaleimide triazine (BT) resins, which are widely used in printed circuit board (PCB) manufacturing, electronic component package protection, and dielectric layers in high-frequency circuits. With the continuous development of 5G technology, the future of electronic grade resins will move towards lower signal loss and higher performance to meet the increasingly demanding needs of electronic devices.

The global 5G Electronic Grade Resin market size was estimated at USD 3710.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.10% during the forecast period.
