Report Overview

Fronthaul is defined as the fiber-based connection between the baseband unit (BBU) and the remote radio head (RRH) in the RAN infrastructure. Fronthaul has its roots in LTE networks, when carriers first moved radios closer to the antennas. This new link was established to supplement the backhaul connection between the BBU and the central network core. As new 5G use cases roll out, flexible fronthaul configurations have become an important factor in balancing the latency, throughput, and reliability needs of advanced 5G applications. Next-generation RANs are leading to increased fronthaul fiber deployments and a greater reliance on multiplexing, virtualization, and split fronthaul architectures. This makes eCPRI fronthaul one of the most important 5G technologies in the operator survey. VIAVI offers a comprehensive solution for fronthaul performance testing, including fiber link verification, synchronization and timing testing capabilities, and virtual and assurance-based options. This paper mainly studies the 5G fronthaul.
