The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on 9.53mm Low Relaxation PC Strand competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global 9.53mm Low Relaxation PC Strand production reached approximately 538.3 K Tons, with an average global market price of around US\$ 392 per Ton. 9.53mm Low Relaxation PC Strand refers to a prestressed concrete steel strand with a nominal diameter of 9.53mm, featuring low relaxation properties. It is made of high-carbon steel wire rods. After surface treatment, the wire rods are cold-drawn into steel wires, and then a certain number of steel wires are stranded into strands according to the structure of the steel strand, usually in a 1?7 structure, that is, composed of 7 steel wires. Finally, it undergoes a stress-relieving and stabilizing process to form a low-relaxation prestressed concrete steel strand. The tensile strength grade can reach 1860MPa or other high-strength levels, which can provide strong tensile force for prestressed concrete structures. Under the condition of high stress, the stress relaxation value within 1000 hours is relatively low, usually not more than 2.5%. This ensures that the prestress can be maintained for a long time in the concrete structure, reducing the loss of prestress. It is mainly used for the reinforcement of prestressed concrete structures, such as large-span railway and road bridges, major bridges, silos, buildings, dams, floor slabs, foundations, large concrete vessels, atomic reactor buildings, stadiums, airport hangars, pre-cast segments, crane beams, anchorages, and multi-storey industrial buildings.

The global 9.53mm Low Relaxation PC Strand market size was estimated at USD 211.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.80% during the forecast period.
