Abstracts

Abdominal closure systems, also known as abdominal wall closure devices or temporary abdominal closure (TAC) systems, are medical devices designed to manage the open abdomen, a condition where the abdominal wall cannot be closed after surgery due to factors like trauma, infection, or intra-abdominal hypertension. These systems provide a controlled environment to protect internal organs, manage fluid drainage, prevent abdominal compartment syndrome, and facilitate planned reoperations, ultimately aiming to achieve delayed primary fascial closure or prepare the abdomen for later reconstructive surgery. They include negative pressure wound therapy (NPWT) systems, mesh-mediated techniques, dynamic retention sutures, and other commercially available products that maintain domain, reduce edema, and minimize complications associated with prolonged open abdomen management.

The global Abdominal Closure System market size was estimated at USD 287.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
