Report Overview:

An abdominal stimulator is a belt that employs electrical muscle stimulation (EMS). The small electrodes attached to the belt pass an electrical current through the bare skin, causing the muscles in the abdominal region to contract. The principle behind the functioning of an abdominal stimulator is an electrical stimulation that causes the muscles to contract. This presumably helps in the strengthening and growth of muscles, acting as a substitute for your daily exercise. While EMS may sound similar to Transcutaneous Electrical Nerve Stimulation (TENS) devices, they have different uses. TENS stimulates the nerves to provide therapy and pain relief, while EMS stimulates muscles to contract and is used for muscle retaining and to help prevent muscle atrophy in bedridden patients.
