Report Overview

Laparoscopic surgical robots are widely used in surgical operations with the advantages of small surgical wounds, high operating precision, strong flexibility, good repeatability, and no influence of human physiological factors such as fatigue and emotions. From the perspective of key components, it mainly includes a doctor control system, a 3D imaging video imaging platform, and a mobile platform composed of a robotic arm, a camera arm and surgical instruments. The 3D imaging video imaging platform can provide doctors with immersive and clear and detailed images of anatomical tissue structures to enhance the visual sense of surgery. The robotic arm can realize various surgical operations such as grasping, clamping, and suturing, and has a wider degree of freedom of movement than a human hand. When performing the operation, the surgeon does not directly contact the patient, but operates and controls it through the three-dimensional vision system and the motion calibration system, and completes the doctor's technical movements and surgical operations through the robotic arm and surgical instruments.

The global Abdominal Surgery Robot market size was estimated at USD 753.30 million in 2023 and is projected to reach USD 1230.11 million by 2032, exhibiting a CAGR of 5.60% during the forecast period.
