Abstracts

Absorbable fibrin glue, also known as fibrin sealant, is a biocompatible surgical adhesive derived from human or animal plasma components, primarily consisting of fibrinogen and thrombin, which, when combined, mimic the final stage of the natural blood coagulation cascade to form a stable fibrin clot that provides hemostatic, sealing, and tissue-adhering properties in a variety of medical procedures; it is characterized by its biodegradability, as the fibrin matrix is gradually broken down by the body's natural fibrinolysis processes, eliminating the need for surgical removal and reducing foreign body reactions, making it particularly valuable in surgeries where conventional sutures, staples, or synthetic adhesives are less effective or impractical, such as in cardiovascular, orthopedic, plastic, and neurological operations, as well as in wound management and organ attachment applications.

The global Absorbable Fibrin Glue market size was estimated at USD 420.55 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
