Report Overview:

According to material classification, absorbable scaffolds are mainly divided into two categories: absorbable polymer scaffolds and absorbable metal scaffolds. The former is mainly composed of L-poly(lactic acid) (PLLA), while the latter includes three types: magnesium alloy, iron alloy, and zinc alloy. Absorbable polymer scaffolds were the earliest to be commercialized, so there are many companies both domestically and internationally choosing this route. However, the mechanical properties of poly(lactic acid) are much lower than those of metal materials. To maintain sufficient support, it is necessary to make the scaffold thicker, the trabeculae wider, and the vascular coverage higher. Obstructing stent endothelialization, activating platelets, and promoting thrombosis, with limited specifications and inconvenient operation.

The Global Absorbable Polymer Stents Market Size was estimated at USD 632.57 million in 2023 and is projected to reach USD 1043.49 million by 2029, exhibiting a CAGR of 8.70% during the forecast period.
