Report Overview

Absorbable surgical sutures are medical devices used for wound closure that are designed to be absorbed by the body over time. These sutures are typically made from materials such as catgut, polyglactin, or polyglycolic acid, which are broken down and eventually metabolized by the body. Absorbable sutures are commonly used in surgeries where the sutures do not need to be removed, reducing the need for a second procedure. They are preferred in areas where scarring is a concern or in internal surgeries where removing sutures would be difficult.

The market for absorbable surgical sutures is experiencing steady growth due to several market drivers. The increasing number of surgical procedures globally, driven by factors such as the aging population, rising prevalence of chronic diseases, and advancements in surgical techniques, is boosting the demand for absorbable sutures. Additionally, the growing focus on reducing healthcare-associated infections is leading to a preference for absorbable sutures over non-absorbable ones, as they reduce the risk of infection by eliminating the need for suture removal. Moreover, technological advancements in suture materials and designs are enhancing the performance and efficacy of absorbable sutures, further driving market growth.
