Abstracts

Typically, absorbent surgical mats consist of multiple layers. The top layer is often a soft, non-woven fabric that is in direct contact with the patient and the surgical field. This layer is designed to quickly wick away fluids, ensuring a dry surface. Beneath the top layer is an absorbent core, which is usually made of materials like cellulose fibers, wood pulp, or superabsorbent polymers. This core is responsible for holding a large volume of fluids. The bottom layer is a waterproof barrier, often made of polyethylene or other plastic-like materials, which prevents fluids from leaking onto the operating table or other surfaces. Some surgical mats come with an adhesive backing. This allows them to be firmly attached to the operating table or other equipment, preventing them from shifting during the surgical procedure.

The global Absorbent Surgical Mats market size was estimated at USD 368.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
