Abstracts

Acarbose (CAS 56180-94-0) is an oral anti-diabetic drug classified as an alpha-glucosidase inhibitor, which functions by delaying the digestion of complex carbohydrates and disaccharides in the small intestine, thereby reducing postprandial blood glucose levels. It is primarily prescribed for the management of type 2 diabetes mellitus, either as monotherapy or in combination with other glucose-lowering agents, and works by competitively inhibiting enzymes such as alpha-amylase and alpha-glucosidase, resulting in a slower absorption of glucose and a moderated insulin response. The compound is derived from Actinoplanes bacteria and is structurally similar to oligosaccharides, allowing it to bind effectively to carbohydrate-hydrolyzing enzymes without being metabolized, making it particularly useful for patients aiming to control glycemic excursions after meals.

The global Acarbose (Cas 56180 94 0) market size was estimated at USD 1685.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
