Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Acceleration Temperature Integrated Sensor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The acceleration temperature integrated sensor is a composite sensor that integrates an acceleration sensor and a temperature sensor together. Acceleration sensors typically detect acceleration by utilizing the principle of a mass spring system, which utilizes the displacement of a mass block (usually a tiny mass) under the action of acceleration. The displacement of the mass block will be converted into an electrical signal, which will be amplified and processed to output the acceleration value.

Temperature sensors are typically based on the principle of thermistors or thermocouples, reflecting changes in temperature by measuring changes in resistance or voltage. As the temperature changes, the resistance in the temperature sensor will change and be converted into a readable electrical signal. In 2024, global Acceleration Temperature Integrated Sensor production reached approximately 45200 k?units , with an average global market price of around US\$ 13 per?unit.

The global Acceleration Temperature Integrated Sensor market size was estimated at USD 587.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
