Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Accumulator Shells competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Accumulator shells are the pressurized outer containers of hydraulic accumulators, used to seal and contain the internal energy storage medium (such as compressed gas, hydraulic oil, or springs). In high-pressure hydraulic systems, they store energy, buffer pressure shocks, stabilize system pressure, and provide emergency oil supply. Typically made of high-strength alloy steel or stainless steel, these shells offer excellent pressure resistance, sealing, and fatigue resistance. Structural forms include tubular, spherical, and diaphragm types, and their design must comply with pressure vessel safety standards. Accumulator shells are widely used in engineering machinery, wind power generation, metallurgical equipment, aerospace, and other fields, and are key components for ensuring the safe and stable operation of hydraulic systems. In 2024, the global production of accumulator shells will reach 171,190 pieces, with an average selling price of US\$3,000 per piece.

The global Accumulator Shells market size was estimated at USD 514.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
