Report Overview

The acetabular cup is a critical component in total hip replacement surgery, designed to replace the damaged acetabulum (hip socket) and provide a stable articulation surface for the femoral head implant. Typically made from durable materials such as polyethylene, ceramic, or metal alloys, acetabular cups are engineered to withstand long-term wear and stress while promoting osseointegration. Modern designs often incorporate porous coatings or hydroxyapatite layers to enhance bone ingrowth and fixation. The geometry and fixation method (cemented or cementless) vary based on patient anatomy and surgical approach, with modular systems allowing surgeons to customize fit and stability. Innovations like dual-mobility cups and bearing surface advancements aim to reduce dislocation risks and improve longevity, making them a focal point in orthopedic implant development.

The global Acetabular Cups market size was estimated at USD 500.55 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
