Abstracts

Acetylcysteine injection is a pharmaceutical formulation of the N-acetyl derivative of the naturally occurring amino acid L-cysteine, administered intravenously to treat acetaminophen (paracetamol) overdose by replenishing hepatic glutathione stores and preventing hepatotoxicity. Its mechanism involves acting as a precursor for glutathione synthesis, facilitating detoxification of the toxic metabolite N-acetyl-p-benzoquinone imine (NAPQI), and it is also used off-label as a mucolytic agent in certain respiratory conditions to break down disulfide bonds in thick mucus secretions. The product is classified as an essential antidote and is typically available in sterile vials or prefilled syringes for hospital and clinical use, requiring strict adherence to dosing protocols due to potential anaphylactoid reactions.

The global Acetylcysteine Injection market size was estimated at USD 320.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
