Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Acne Skin Model competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Acne Skin Model production reached approximately 2.39 M units, with an average global market price of around US\$ 160 per unit. An Acne Skin Model refers to a biological or synthetic system that replicates the structural, cellular, and pathological characteristics of human skin affected by acne vulgaris. These models are designed to simulate the interaction between skin cells, sebaceous glands, and microorganisms such as *Cutibacterium acnes* (formerly *Propionibacterium acnes*) under inflammatory conditions.

Gross Profit Margin Analysis The overall gross profit margin of the acne skin model industry is at a medium-to-high level, generally between 45% and 65%, with some companies possessing independent biological tissue culture systems or high-precision simulation manufacturing processes achieving gross profit margins exceeding 70%. This level is primarily due to high product technology barriers, long production cycles, and strong customer customization demands. Biological models, such as 3D reconstructed skin models, require maintaining a strictly sterile and active environment, resulting in significantly higher material costs and technological investment compared to traditional teaching models. Simultaneously, downstream pharmaceutical companies, cosmetic R&D institutions, and medical aesthetic research centers have extremely high requirements for model quality and repeatability, keeping prices stable. Because these products are irreplaceable in the R&D and testing processes, the industry generally adopts a high-value-added pricing strategy to ensure strong profit margin resilience over a long period.

Industry Driving Factors The growth of the acne skin model industry is driven by multiple factors. First, increasingly stringent global bans on animal testing and ethical reviews are prompting cosmetic and pharmaceutical companies to accelerate

the use of in vitro skin models for safety and efficacy verification. Secondly, as one of the most prevalent skin diseases globally, acne continues to generate strong demand for related drug, skincare product, and medical device research and development, creating a stable market for model applications. Technologically, innovations in 3D bioprinting, microfluidic chips, and tissue engineering materials have significantly improved the physiological relevance and reproducibility of models, facilitating greater commercialization. Simultaneously, the rapid expansion of the medical aesthetics and personalized skincare industries has spurred demand for customized acne models to validate novel active ingredients, microneedling, phototherapy, and other treatment methods. Overall, the synergistic effect of the regulatory environment, scientific research innovation, and market applications is continuously driving the acne skin model industry towards higher value-added and diversified development.

The global Acne Skin Model market size was estimated at USD 382.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
