Abstracts

Acoustic based biosensors represent a class of analytical devices that utilize acoustic waves?most commonly surface acoustic waves (SAW) or bulk acoustic waves (BAW)?to detect and quantify biological or biochemical interactions by measuring changes in wave propagation properties such as frequency, phase, or amplitude when a target analyte binds to a functionalized sensor surface. These sensors are highly sensitive, label-free, and capable of real-time monitoring, making them particularly valuable for applications in medical diagnostics (e.g., detection of pathogens, biomarkers, or DNA), food safety (e.g., identification of contaminants or spoilage organisms), and environmental monitoring (e.g., sensing toxins or pollutants in air or water). Their operation relies on piezoelectric materials to generate and receive acoustic signals, offering advantages such as miniaturization potential, low power consumption, and compatibility with integrated circuit technologies, though they may face challenges related to non-specific binding, signal stability in complex matrices, and the need for precise surface functionalization to ensure selectivity and reproducibility.

The global Acoustic Based Biosensors market size was estimated at USD 415.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.15% during the forecast period.
