## Abstracts

An Acoustic Doppler Log (ADL) is a type of sonar-based instrument used primarily in marine and hydrological applications to measure the velocity of water currents. It operates by emitting sound waves and analyzing the Doppler shift of the reflected signals from particles or objects in the water. The change in frequency of the returned sound waves provides data on the flow velocity and direction of the water, which is crucial for monitoring currents, sediment transport, and other hydrodynamic conditions. Acoustic Doppler Logs are widely used in oceanography, river studies, and environmental monitoring, offering high-precision measurements without the need for physical contact with the water.

The global Acoustic Doppler Log market size was estimated at USD 115.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Acoustic Doppler Log market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
