Report Overview

An acoustic metamaterial is a material designed to control, direct, and manipulate sound waves as these might occur in gases, liquids, and solids. The hereditary line into acoustic metamaterials follows from theory and research in negative index material. Furthermore, with acoustic metamaterials, controlling sonic waves can now be extended to the negative refraction domain. Control of the various forms of sound waves is mostly accomplished through the bulk modulus ρ , mass density ρ , and chirality. The density and bulk modulus are analogies of the electromagnetic parameters, permittivity and permeability in negative index materials. Related to this is the mechanics of wave propagation in a lattice structure. Also materials have mass, and intrinsic degrees of stiffness. Together these form a resonant system, and the mechanical (sonic) resonance may be excited by appropriate sonic frequencies (for example pulses at audio frequencies).

The global Acoustic Metamaterial market size was estimated at USD 34 million in 2023 and is projected to reach USD 1260.77 million by 2032, exhibiting a CAGR of 49.40% during the forecast period.

North America Acoustic Metamaterial market size was estimated at USD 17.95 million in 2023, at a CAGR of 42.34% during the forecast period of 2024 through 2032.
