Abstracts

Acoustic release systems are specialized underwater devices designed to facilitate the controlled retrieval of submerged equipment, such as oceanographic sensors, moorings, and scientific instruments, by using encoded acoustic signals to trigger a release mechanism that disconnects the payload from its anchor. These systems are essential in environments where direct human intervention is impractical or impossible, relying on the transmission of sound waves through water to communicate commands from a surface vessel or operator to the release unit, which then mechanically or electrically activates to free the attached load. The technology typically incorporates fail-safe features, such as backup release mechanisms or timed releases, to ensure reliability in harsh marine conditions, and it is engineered to operate effectively across varying depths, pressures, and acoustic environments while minimizing power consumption to support long-term deployments.

The global Acoustic Release Systems market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
