Abstracts

The acoustic release transponder is a specialized underwater electronic device used primarily in marine and offshore operations for precise positioning, data retrieval, and equipment recovery. It functions by receiving and responding to acoustic signals transmitted from a surface vessel or underwater vehicle, enabling two-way communication without the need for physical tethers or cables. These systems are critical for applications such as deep-sea exploration, oceanographic research, subsea infrastructure monitoring, and military operations, where they facilitate tasks like releasing anchored instruments, relaying sensor data, or marking specific locations on the seafloor with high accuracy even in challenging conditions like turbid water or extreme depths.

The global Acoustic Release Transponder market size was estimated at USD 42.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
