Report Overview:

Acoustic Wave Sensors are a class of microelectromechanical systems (MEMS) which rely on the modulation of surface acoustic waves to sense a physical phenomenon. The sensor transduces an input electrical signal into a mechanical wave which, unlike an electrical signal, can be easily influenced by physical phenomena. The device then transduces this wave back into an electrical signal. Changes in amplitude, phase, frequency, or time-delay between the input and output electrical signals can be used to measure the presence of the desired phenomenon.

The Global Acoustic Wave Sensor Market Size was estimated at USD 496.78 million in 2023 and is projected to reach USD 708.69 million by 2029, exhibiting a CAGR of 6.10% during the forecast period.
