### Report Overview

An acousto-optic mode locker (AOML) is a specialized modulator operating within the laser cavity to actively control the loss and induce a fixed-phase relationship between multiple longitudinal modes of the laser cavity. The loss it introduces may be very small, but it need only be enough to preferentially select specific modes.

The number of active modes of a laser will depend both on its gain medium and on the cavity length, but they may not be in phase. A mode locker operating at a frequency synchronized with the round trip time of the laser cavity will allow only those modes which are in phase to build up and interfere constructively, thus generating high intensity pulses at a well-defined repetition rate. To achieve mode locking, the laser cavity mode spacing frequency (length) must be equal to twice the acoustic frequency of the mode locker.
