Abstracts

Acquired aplastic anemia is a rare and serious hematologic disorder characterized by bone marrow failure, leading to pancytopenia—a deficiency of all three major blood cell types (red blood cells, white blood cells, and platelets)—resulting from autoimmune-mediated destruction of hematopoietic stem cells rather than an inherited genetic cause. It is distinguished by hypocellular bone marrow without significant fibrosis or abnormal cell infiltration, and its onset is often idiopathic, though it can be triggered by exposure to certain chemicals, drugs, radiation, viral infections, or autoimmune conditions. Diagnosis relies on peripheral blood counts and bone marrow biopsy findings, and treatment varies based on severity, ranging from supportive care (such as transfusions and antibiotics) to immunosuppressive therapy or allogeneic hematopoietic stem cell transplantation, which remains the only curative option for eligible patients. The condition has significant morbidity and mortality if untreated, emphasizing the need for prompt diagnosis and specialized management.

The global Acquired Aplastic Anemia market size was estimated at USD 315.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
