Report Overview

Acrylic acid derivatives are important raw materials for the manufacture of a wide variety of industrial and consumer products. In the theme of sustainability, more economical methods that utilize cheaper and less toxic feedstock are urgently needed. Clean pathways can be realized through the direct functionalization of CO₂, which plays a dual role of reducing the CO₂ emission rate and producing chemicals with added value. Because ethylene is one of the most abundant industrial feedstocks, manufacturing acrylic acid and acrylates directly from CO₂ and ethylene becomes both scientifically fascinating and industrially relevant. As a dream reaction in catalysis and CO₂ utilization, this challenging transformation has drawn close attention for nearly 40 years. With continuous efforts from both academia and industry, scientists are getting close to realizing an effective catalytic system. This review covers critical discoveries and discusses possible future directions in this area.

The global Acrylic Acid Derivatives market size was estimated at USD 556.40 million in 2023 and is projected to reach USD 924.18 million by 2032, exhibiting a CAGR of 5.80% during the forecast period.
