Abstracts

Activated alumina beads refer to highly porous, granular forms of aluminum oxide (Al_2O_3) that have been thermally treated to achieve a large surface area and strong adsorption properties, making them ideal for applications such as water treatment (fluoride and arsenic removal), air and gas drying, catalyst support in petroleum refining, and as a desiccant for protecting moisture-sensitive goods; their physical and chemical stability, along with regenerability, distinguish them from alternative adsorbents like silica gel or molecular sieves in specific industrial processes.
