Abstracts

Activated carbon injection (ACI) refers to the process of injecting finely powdered activated carbon into flue gas streams, primarily in industrial and power generation settings, to adsorb and remove pollutants such as mercury, dioxins, furans, and other hazardous air pollutants before they are released into the atmosphere. This technology is widely regarded as a best available control technology (BACT) for mercury removal, leveraging the high surface area and adsorptive properties of activated carbon to capture gaseous contaminants through physical and chemical adsorption mechanisms. ACI systems are integral components of air pollution control strategies, often used in conjunction with other emission control technologies like fabric filters or electrostatic precipitators to achieve regulatory compliance and minimize environmental impact.

The global Activated Carbon Injection market size was estimated at USD 350.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
