Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Active CPU Heatsink competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An active CPU heatsink is a thermal dissipation device for central processing units (CPUs) that includes active cooling elements ? typically a fan or blower (or a pump+liquid loop, in liquid-cooled variants) ? to move air or coolant over a finned or heat-pipe/radiator structure, thereby enhancing convective heat removal beyond what passive conduction/convection alone can achieve. Upstream supplies include raw materials (aluminum, copper, polymers), heat-pipe materials, fan motors (brushless DC motors), bearings, radiators, liquid pump components, thermal interface materials, and machining / extrusion / stamping / CNC suppliers; midstream manufacturers design, build and assemble the heatsink + fan / radiator / pump units, develop thermal design (CFD modelling, heat-pipe layout, fin geometry), test under standards, integrate with OEMs or sell aftermarket; downstream the distribution, retail/e-commerce channels, OEM system integrators, PC OEMs, server OEMs, and end consumers, with support/after-sales, warranty, thermal accessory branding, and replacement parts. Production involves extrusion or stamping of base heatsink fin frames, CNC machining of base / cold plate surfaces, fabrication of heat pipes, bonding or soldering of fins or heat pipes, integration of fan motors (brushless, bearing systems) or liquid cooling components (cold plate, pump, radiator), application of surface treatments (nickel plating, anodizing), assembly and balancing of fans, thermal interface material application, testing for airflow, noise, thermal resistance, TDP capacity, reliability (vibration, lifetime), and packaging / OEM qualification; more advanced designs employ CFD modelling, micro-fin or vapor chamber structures, hybrid cooling, and materials optimization (e.g. copper + aluminum mixes) to boost heat transfer per unit cost. 2024
