## Abstracts

The process to rendezvous with a piece of space junk and remove it from orbit is called active debris removal. Active Debris Removal in Space (ADSS) aims to clean up space debris such as abandoned satellites and rocket remains in orbit using technological means, and is a key measure to maintain the sustainable use of the space environment. Dense debris in space orbit poses a direct threat to trillions of dollars worth of space assets, such as communication, navigation, and remote sensing satellites. A single collision could trigger a chain reaction, rendering an entire orbital area unusable. Protecting critical assets in orbit has become the most direct and urgent market demand. The sustainable development of the space economy depends on a safe and stable orbital environment. Debris removal services are the cornerstone and insurance for maintaining this foundation. International organizations such as the UN Committee on the Peaceful Uses of Outer Space continue to promote sustainable space development. Although there is no mandatory international law yet, guidelines such as "deorbiting within 25 years" are becoming the industry standard. In the future, the introduction of stricter "polluter pays" principles or orbital usage fee mechanisms will directly create a huge policy market for debris removal services. Commercial space companies (such as SpaceX) have significantly reduced launch costs through technologies such as rocket recovery. This has lowered the barriers and costs of deploying debris removal vehicles. The modular and standardized design of satellite platforms is also reducing the manufacturing costs of the vehicles required for debris removal services.

The global Active Debris Removal market size was estimated at USD 495.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 27.60% during the forecast period.
