Abstracts

An active degaussing system is a specialized electronic apparatus designed to neutralize or eliminate unwanted residual magnetic fields in and around vessels, vehicles, or sensitive equipment, primarily through the generation of controlled counteracting magnetic fields; it functions by continuously monitoring ambient magnetic signatures using an array of sensors and adjusting the output of degaussing coils in real-time to compensate for magnetic anomalies, thereby reducing the magnetic detectability of the protected object?a critical feature for naval and military applications aimed at minimizing susceptibility to magnetic mines or detection systems, as well as in industrial or scientific settings where electromagnetic interference must be rigorously managed to ensure operational integrity and precision.

The global Active Degaussing System market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
