Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Active Electrical Cables (AEC) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Active Electrical Cables (AECs) are high-speed data transmission cables that incorporate active electronic components?such as signal amplifiers, equalizers, or clocking circuits?within the cable assembly to boost and manage signal quality. Unlike passive cables, which rely solely on the physical conductors, AECs actively compensate for signal degradation over longer distances or higher data rates. This allows them to support faster transmission speeds while maintaining thinner, more flexible cable designs. AECs are commonly used in data centers, high-performance computing, and telecommunications to connect servers, switches, and storage devices efficiently with lower power consumption and improved cable management. Active Electrical Cables (AECs) have rapidly emerged as a high-growth segment within the high-speed interconnect market, driven by the accelerating demand for high-bandwidth, cost-efficient, and thermally optimized connectivity in modern data center environments. As cloud service providers, hyperscalers, and AI infrastructure builders scale toward 400G, 800G, and beyond, traditional passive copper cables (DACs) are reaching their performance and reach limits. AECs offer a compelling alternative: they retain the lower cost and power advantages of copper while incorporating embedded electronics to enable longer reach (up to 7?10 meters) and better signal integrity at high data rates. The AEC market is increasingly favored by hyperscale data center operators seeking to delay the full shift to Active Optical Cables (AOCs), which are more expensive and power-hungry. AECs now serve as a ?transition solution? between DACs and AOCs in rack-to-rack and leaf-to-spine deployments, especially in AI/ML server clusters where density, cable management, and thermal load are critical. Leading

vendors?including Amphenol, TE Connectivity, Molex, and Credo?are investing in next-gen AEC modules capable of handling 112 Gbps per lane and scaling toward 224 Gbps, aligning with upcoming 800G and 1.6T system designs. While demand is currently strongest in North America and China, AEC adoption is expected to expand globally as OEMs and telecom operators seek more efficient 100G/200G/400G interconnect solutions. Challenges remain, including standardization, interoperability, and limited market awareness, but as interoperability improves and costs decline, AECs are poised to play a pivotal role in future-proofing short-reach connectivity across AI, cloud, and enterprise networks.

The global Active Electrical Cables (AEC) market size was estimated at USD 218.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 28.20% during the forecast period.
