Active Heave Compensation (AHC) systems are designed to stabilize loads during lifting operations in maritime and offshore environments. There are several types of AHC systems, which can be categorized based on their operational principles and design features: 1. Hydraulic AHC Systems: these systems use hydraulic cylinders and accumulators to counteract vessel motion and maintain load stability. They are commonly used in cranes and winches. 2. Electric AHC Systems: those systems utilize electric motors and drive systems for load stabilization. They often include sophisticated control algorithms for real-time response to vessel movement. 3. Hybrid AHC System: hybrid systems combine hydraulic and electric components, allowing for flexibility and efficiency. They leverage the strengths of both technologies to enhance performance.
