Report Overview:

An active magnetic bearing works on the principle of electromagnetic suspension based on the induction of eddy currents in a rotating conductor. When an electrically conducting material is moving in a magnetic field, a current will be generated in the material that counters the change in the magnetic field (known as Lenz's Law). This generates a current that will result in a magnetic field that is oriented opposite to the one from the magnet. The electrically conducting material is thus acting as a magnetic mirror.

Active bearings have several advantages: they do not suffer from wear, have low friction, and can often accommodate irregularities in the mass distribution automatically, allowing rotors to spin around their centre of mass with very low vibration.

The Global Active Magnetic Bearing Systems Market Size was estimated at USD 293.59 million in 2023 and is projected to reach USD 423.59 million by 2029, exhibiting a CAGR of 6.30% during the forecast period.
