Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Active Matrix OLED (AMOLED) Display competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An Active Matrix Organic Light-Emitting Diode (AMOLED) display is an advanced display technology that integrates organic light-emitting diodes (OLEDs) with an active matrix addressing scheme. Its structure comprises full layers of cathode, organic molecules, and anode, with the anode overlaying a thin-film transistor (TFT) array that forms a matrix. The TFT array serves as the control circuitry, precisely determining which pixels are activated to form images. Compared to passive matrix OLEDs (PMOLEDs), AMOLEDs significantly reduce power consumption by minimizing the need for external circuitry through the TFT array, making them suitable for large displays. The self-emissive pixels of AMOLEDs eliminate the need for a backlight, enabling deep blacks, high contrast, and vibrant colors, while offering superior optoelectronic properties such as fast response times, high refresh rates, and wide viewing angles, supporting high-resolution and dynamic video display. Manufacturing typically employs advanced deposition techniques, such as cluster evaporation machines, to ensure the uniformity of organic material layers. In the mid-to-large-size display market, AMOLEDs have become the dominant OLED technology due to their high added value and significant growth potential.

The global Active Matrix OLED (AMOLED) Display market size was estimated at USD 1030.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.00% during the forecast period.
