Report Overview

Active noise canceling headphones reduce unwanted ambient sounds using active noise control. This is distinct from passive headphones which, if they reduce ambient sounds at all, use techniques such as soundproofing. Active noise cancellation makes it possible to listen to audio content without raising the volume excessively. It can also help a passenger sleep in a noisy vehicle such as an airliner. In the aviation environment, active noise-cancelling headphones increase the signal-to-noise ratio significantly more than passive noise attenuating headphones or no headphones, making hearing important information such as safety announcements easier. Active noise-cancelling headphones can improve listening enough to completely offset the effect of a distracting concurrent activity.

The global Active Noise Canceling Headphones market size was estimated at USD 14750 million in 2023 and is projected to reach USD 42236.59 million by 2032, exhibiting a CAGR of 12.40% during the forecast period.

North America Active Noise Canceling Headphones market size was estimated at USD 4703.85 million in 2023, at a CAGR of 10.63% during the forecast period of 2024 through 2032.
